

WHAT IS CLAIMED IS:

5       1. A power control center apparatus configured to  
remotely distribute power, the apparatus comprising:

an enclosure;

a first line voltage receptacle mounted on the enclosure;

10      a second line voltage receptacle mounted on the  
enclosure;

a low voltage receptacle mounted on the enclosure;

15      a first timer coupled to the first line voltage  
receptacle and configured to control output of voltage  
supplied from the first line voltage; and

15      a second timer coupled to the low voltage receptacle and  
configured to control output of voltage supplied from the low  
voltage receptacle.

20      2. The apparatus of claim 1 wherein the enclosure is  
mountable.

25      3. The apparatus of claim 1 further comprising an input  
voltage line coupled to the enclosure and configured to  
continuously supply voltage to the first line voltage.

30      4. The apparatus of claim 1 further comprising a  
transformer coupled to the input voltage line.

35      5. The apparatus of claim 4 wherein the transformer has  
a primary winding, a secondary winding, and a copper shield  
separating the primary winding from the secondary winding.

6.     The apparatus of claim 4 wherein the transformer is  
a electronic transformer.

5

7.     The apparatus of claim 4 wherein the transformer is  
configured to prevent unexpected voltage from the primary  
winding being transferred to the secondary winding.

10

8.     The apparatus of claim 7 further comprising a power  
source remotely located from the enclosure and coupled to the  
input voltage line.

15

9.     The apparatus of claim 1 wherein the second timer is  
programmable to allow supply of voltage from the low voltage  
receptacle at specified times.

20

10.    The apparatus of claim 1 wherein the first timer is  
programmable to allow supply of voltage from the first line  
voltage receptacle at specified times.

25

11.    The apparatus of claim 1 further comprising a cover  
curved and extending over the first line voltage receptacle,  
second line voltage receptacle, low voltage receptacle, the  
first timer, and the second timer.

30

12.    The apparatus of claim 11 wherein the first line  
voltage receptacle is configured to receive a first voltage  
connection, the second line voltage receptacle is configured  
to receive a second voltage connection, and the first and  
35     second voltage connections are partially encased by the cover.

5           13. The apparatus of claim 12 wherein the cover defines  
an inside portion encasing a portion of the enclosure and  
being proximate the first line voltage receptacle, the second  
line voltage receptacle, the low voltage receptacle, the first  
timer, and the second timer, and wherein the first and second  
10 voltage connections extend away from the enclosure and the  
inside portion of the cover.

15           14. The apparatus of claim 11 wherein the cover is  
movable to assist in accessing one of the first line voltage  
receptacle, the second line voltage receptacle, the low  
voltage receptacle, the first timer, and the second timer.

20           15. The apparatus of claim 11 wherein the cover is  
transparent to assist in programming one of the first timer  
and the second timer.

25           16. The apparatus of claim 11 wherein the cover and  
enclosure are made of an impact and water resistant material.

30           17. A method of remotely distributing power using a  
power control center apparatus, the method comprising:  
              receiving voltage from an input voltage line;  
              supplying a first line voltage from the received voltage;  
              supplying a second line voltage from the received  
              voltage;  
              supplying a low voltage having a voltage level less than  
35           the first line voltage; and

5                  regulating the supplying of the first line voltage and  
the supplying of the low voltage.

10                 18. The method of claim 17 further comprising converting  
voltage from the line input voltage input to the low voltage.

15                 19. The method of claim 17 wherein the first line  
voltage is supplied through a first line voltage receptacle,  
the second line voltage is supplied through a second line  
voltage receptacle, and the low voltage is supplied through a  
low voltage receptacle; and further comprising covering the  
first line voltage receptacle, the second line voltage  
receptacle and the low voltage receptacle.

20                 20. The method of claim 19 further comprising mounting  
the first line voltage receptacle, the second line voltage  
receptacle and the low voltage receptacle on an enclosure.

25                 21. A power control center apparatus configured to  
remotely distribute power, the apparatus comprising:

                       an enclosure having a plurality of sides, a top and a  
bottom;

                       a first line voltage receptacle mounted on one of the  
plurality of sides;

30                 a second line voltage receptacle mounted on the one of  
the plurality of sides;

                       a low voltage receptacle mounted on the one of the  
plurality of sides;

an input voltage line built into the enclosure and having one end extending out from the bottom of the enclosure;

5       a first timer having a display and actuators and configured to control output of voltage supplied from the first line voltage, the supplied voltage corresponds to voltage supplied by the input voltage line and the display and actuators are mounted on the one of the plurality of sides and proximate to the first line voltage receptacle;

10      a second timer having a display and actuators and configured to control output of voltage supplied from the low voltage receptacle, the supplied voltage is less than the voltage supplied by the input voltage line and the display and actuators are mounted on the one of the plurality of sides and proximate the low voltage receptacle; and

15      a movable cover arranged to extend over the first line voltage receptacle, the second line voltage receptacle, the low voltage receptacle, the first timer and the second timer and attached to two sides of the plurality of sides, each of the two sides being adjacent to the one of the plurality of sides.

20      22. The apparatus of claim 21 further comprising a transformer mounted inside the enclosure and connected to the low voltage receptacle and configured to lower the voltage supplied by the input voltage line, the transformer having a primary winding, a secondary winding and a copper ground shield between the primary winding and the secondary winding.
